(54) Title: A DISPOSABLE LANCET COMBINED WITH A REAGENT CARRYING STRIP AND A SYSTEM FOR EXTRACT-
ING AND ANALYSING BLOOD IN THE BODY UTILIZING SUCH A DISPOSABLE LANCET

(57) Abstract: A disposable lancet combined with
a reagent carrying strip which carries a reagent that
indicates the concentration of a blood component in
a blood sample placed in contact with the strip. The
lancet has one end, which is sharpened for piercing
the skin of a user and has the reagent carrying strip
connected to the lancet e.g. by moulding. The strip
is sheet-like and has a first side and a second side,
which sides are both accessible for the user, such
that the reagent carrying strip can be inserted into
a blood glucose meter without having to disconnect
the strip from the lancet. It is however possible to
disconnect the strip from the lancet if so wanted.

WO 01/72225 A1

A disposable lancet combined with a reagent carrying strip and a system for extracting and analysing blood in the body utilizing such a disposable lancet.

5 The invention relates to a disposable lancet combined with a reagent carrying strip. The lancet has a sharp distal end for piercing the skin of a user, and a reagent carrying strip, which reacts to a blood sample.

The invention furthermore relates to a system for extracting and analysing blood in a body utilizing a disposable lancet in combination with a reagent carrying strip.

10 Patients with certain illnesses like diabetes must verify several times a day the sugar content of their blood. This is often done by placing a drop of blood on to a reagent carrying strip, which causes the reactive reagent on the strip to react with the blood. Usually the reagent carrying strip carries an enzyme that reacts with the blood component to be measured. The
15 result of the test is read by a blood glucose meter before or/and after applying blood. Most such blood glucose meters on the market today either reads the change of colour due to the chemical reaction, or it reads the current produced from the chemical reaction between reagent or blood glucose.

20 The drop of blood is obtained by piercing the tip of a finger or the earlap using a portable skin pricker E.g. as known from US A 4.469.110. Such a skin pricker comprises of a disposable lancet, a lancet holder and a body. The holder is, when armed, worked upon by a spring. When firing the skin pricker, the disposable lancet inserted in the holder is shot forward by the spring. By pressing the tip of the finger against the skin pricker the finger is pierced by
25 the sharp end of the lancet. A droop of blood can then be obtained from the punctured finger and placed onto the reagent carrying strip. After use the lancet is disposed of. When the change in the reagent carried on the strip has been measured, the strip is also disposed of.

30 Next time a blood sample is required, the patient has to place a new lancet in the holder of the skin pricker and get a hold of a new reagent carrying strip. The reagent carrying strips are often carried in a separate container, which is very inconvenient, since such a separate container are often forgotten or mislaid. Some times the container is integrated with the skin pricker, but since the lancet and the reagent carrying strip are two separate pieces, they are often available in an unequal number. The user therefore often runs out of one of the items

first. As a result of this the user must always remember to refill the container with the item needed.

5 In order to avoid these inconveniences the disposable lancet are sometimes combined with the reagent carrying strip. Such blood-sampling units are known from US A 5.231.993 and EP A1 164.148. These known units have a lancet, which is sharpened for piercing the tip of a finger and an integrated reagent carrying strip. They are however not designed to be used in a typical skin pricker of the type described above. The force needed to pierce the finger is delivered by the patient, but for many patients it is psychological difficult to pierce them-
10 selves. Such patients prefer to use an ordinary skin pricker with a disposable lancet. The change of the reagent carrying strip in these known blood-sampling units is unreadable by the standard glucose meters on the market, since these are designed to read an inserted rectangular strip.

15 It is an object of the invention to provide an ordinary disposable lancet for a skin pricker, which lancet is combined with a reagent carrying strip in order to minimise the amount of loose items a diabetes patient has to carry around. It is also an object to provide a disposable lancet combined with a reagent carrying strip, which strip can easily be read in a standard glucose meter.

20 This is obtained by a disposable lancet combined with a reagent carrying strip comprising a lancet, with a distal end, which is sharpened for piercing the skin of the user, and a reagent carrying strip, which carries a reagent that indicates the concentration of a blood component in a blood sample placed in contact therewith,

25 Which disposable lancet combination is characterized in that the reagent carrying strip is a sheet-like strip having a first side and a second side, which sides are both accessible for the user, and that the lancet is connected to the reagent carrying strip.

30 The disposable lancet can be inserted in a skin pricker having the attached reagent carrying strip sliding in a groove in the skin pricker, but the reagent carrying strip could also be disengaged from the lancet before inserting the lancet in the skin pricker. In both ways it is assured that the patient always has a reagent carrying strip available when inserting a new lancet in the skin pricker. After the blood sample has been placed on to the reagent carrying
35 strip, the strip is easily inserted in a standard blood glucose meter.

In one embodiment of the disposable lancet according to the invention the lancet is made from a moldable polymeric material, and the reagent carrying strip is attached to the lancet. Attaching the reagent carrying strip to the lancet can be done by gluing the reagent carrying
5 strip to the lancet. If the reagent carrying strip is made from paper or another fibrous material the strip can however be fasten to the disposable lancet without the use of glue simply by folding the strip around the lancet and apply heat and pressure. The surface of the lancet will then start to melt, and connect to the reagent carrying strip.

10 In another embodiment of the disposable lancet combined with a reagent carrying strip according to the invention the reagent carrying strip is made from a moldable polymeric material, which is moulded around the lancet. Instead of making the strip from a fibrous material as paper, the strip can be made by moulding a moldable polymeric material to a very thin sheet-like strip of film, on to which the reagent material is placed. The lancet can be made by
15 another material, and the reagent carrying strip can be attached to the lancet by moulding it around the lancet.

In another embodiment of the disposable lancet combination according to the invention the reagent carrying strip has a number of edges between the first and the second side, and the
20 lancet is attached to the reagent carrying strip at one of these edges. By applying the disposable lancet onto the reagent carrying strip at one of the edges, disconnecting the two items is made very easy.

In an appropriate embodiment of the disposable lancet according to the invention the lancet
25 is connected to a frame, which frame is attached to the edges of the reagent carrying strip. By framing the reagent carrying strip a stiff construction is possible, which accommodates an easy insertion into the glucose meter.

In yet another embodiment of the disposable lancet combined with a reagent carrying strip
30 according to the invention an arm is connecting the lancet to the reagent carrying strip or to the frame framing the reagent carrying strip. The reagent carrying strip can then be situated a distance from the disposable lancet, but still in connection therewith, forming a combined unit.

In an embodiment of the disposable lancet combined with a reagent carrying strip according to the invention the connecting point between the reagent carrying strip or the frame and the disposable lancet or the arm has a weakened tear line. By this the attached reagent carrying strip can easily be separated from the lancet.

5

In an embodiment of the disposable lancet combined with a reagent carrying strip according to the invention the reagent carrying strip is rectangular. Most glucose meters present on the market accommodates rectangular reagent carrying strips.

10 It is also an object of the invention to provide a system for extracting and analysing blood in a body utilizing a disposable lancet combined with a reagent carrying strip, where the disposable lancet is kept in the same position both when obtaining the blood sample and when analysing the blood sample. In the known systems of this kind e.g. as known from WO A 95/24233, especially figure 25, the blood-coated strip has to be manually removed from the
15 position where it is coated with blood and to the position where the change in the reagent is being measured. This is very inconvenient for the user.

This is obtained by a system for extracting and analyzing blood in a body utilizing a disposable lancet combined with a reagent carrying strip according to anyone of the preceding
20 claims, which system comprises:

a housing including a spring actuated hammer, into which housing the disposable lancet combined with a reagent carrying strip is placed in a guided position,

25 a button which releases the spring actuated hammer, which then pushes forward the disposable lancet combined with a reagent carrying strip,

means for guiding the disposable lancet combination from a retracted position to a deployed position where the tip of the disposable lancet with reagent carrying strip penetrates the skin
30 of the user,

a sensor which senses the changes in the reagent placed on said reagent carrying strip,

a display for showing a visual readout representing the changes in the reagent

35

which system is characterized in that said sensor is situated in a position in the housing where it can sense the changes in the reagent without manually moving the disposable lancet combined with a reagent carrying strip.

- 5 In such a system the disposable lancet combined with a reagent carrying strip just need to be placed in the guided position and fired. There after the user merely has to place a drop of blood onto the reagent carrying strip and to actuate the device, then the change in the reagent is being read without removing the disposable lancet combination from the guided position.

10 The invention will be explained more fully below in connection with a preferred embodiment and with reference to the drawings in which:

- Figure 1 Schematically shows a disposable lancet combination, where the strip is connected through a thin arm.
- Figure 2 Schematically shows a disposable lancet combined with a reagent carrying strip, where the strip is connected directly to the lancet.
- Figure 3 Shows a sectional view along line AA in figure 2.
- Figure 4 A-D Schematically shows a disposable lancet in combination with a reagent carrying strip.
- Figure 5 A Schematically shows a disposable lancet combination having a weakened tear-line.
- Figure 5 B Shows an expanded sectional view along line AA in figure 5 A.
- Figure 6 A-B Schematically shows a side-view and a bottom-view of a disposable lancet combined with a reagent carrying strip, where the lancet is attached to one of the sides of the reagent carrying strip.
- Figure 7 A Schematically shows a disposable lancet combined with a reagent carrying strip, which strip is moulded around the lancet.

Figure 7 B Shows an expanded view along line AA in figure 7 A.

Figure 8 Schematically shows a system for extraction and analysing blood.

The figures are schematic and simplified for clarity, and they just show details, which are essential to the understanding of the invention, while other details are left out. Throughout, the same reference numerals are used for identical or corresponding parts.

Referring now to the drawing, it can be seen that a disposable lancet 1,10 combined with a reagent carrying strip 3 according to the invention comprises a lancet 1,10 with a sharpened distal end 2 for piercing the skin of a patient and a reagent carrying strip 3 connected to the lancet 1,10.

The reagent carrying strip 3 has two sides 4, 5, both or one of which can carry the reagent that indicates the concentration of glucose in a blood sample. When the reagent carrying strip 3 is placed in contact with a blood sample, the reagent part of the reagent carrying strip 3 perform a chemical reaction resulting in for instance a colour change or a current according to the glucose concentration. This change can then be read by a not shown glucose meter, into which the strip 3 is placed.

The disposable lancet 1,10 can be connected to the reagent carrying strip 3 through a thin arm 6. As shown in figure 1 the connecting point 7 between the arm 6 and the reagent carrying strip 3 is situated at one of the edges of the reagent carrying strip 3. The arm 6 or the disposable lancet 1,10 could however be connected to one of the two sides 4, 5 of the reagent carrying strip 3. Figure 6 A-B shows the disposable lancet 1,10 being connected directly to the frame at one of the two sides 4, 5.

Both the disposable lancet 1,10 and the arm 6 can be made of metal, but is preferably made from a mouldable polymeric material. However the material chosen should preferably be a material suitable to be sterilized. In this way the disposable lancets with reagent carrying strip could be sterilized prior to packing the units.

The reagent carrying strip 3 is connected to the lancet 1,10 preferably through gluing, but can also be applied through melting, as is best shown in figure 2 and 3. By folding the reagent carrying strip 3, made from a fibrous material such as paper, around the disposable lancet 1,10, made from a mouldable polymeric material, and applying heat, the polymeric material will tend to melt on the surface and thereby be locked on to the fibrous reagent carrying strip 3.

As shown in figure 4 A-D, the reagent carrying strip 3 can be connected directly to the disposable lancet 1,10, or the reagent carrying strip 3 can be connected to a frame 8, framing a number of the edges of the reagent carrying strip 3.

The frame 8 can as indicated with a dotted line in figure 6 A be designed as one unitary frame – somewhat like a well - into which the reagent is placed, without differing from the scope of the claims. If wanted the unitary frame 8 could have a well-like depression on both sides, both carrying a reagent.

When in use the disposable lancet 1,10 with reagent carrying strip 3 is first inserted into the armed skin pricker. The reagent carrying strip 3 may slide in a groove in the skin pricker. The skin pricker is then fired, and the lancet 1,10 penetrates the skin of the patient. A drop of blood is disposed on to the attached reagent carrying strip 3, which is then placed in a glucose meter. After the reading of the blood glucose value, the disposable lancet 1,10 and the attached reagent carrying strip 3 is disposed of.

Before loading the disposable lancet 1,10 into the skin pricker, the attached reagent carrying strip can be separated from the lancet 1,10. In order to accommodate such a detachment the connecting point 7 between the reagent carrying strip 3, or the frame 8, and the disposable lancet 1,10, or the arm 6, can be equipped with a weakened tear-line, which is best seen in figure 5 B.

The connection 7 between the lancet 1,10 and the frame 8 need not to run along the entire length of a side of the frame as shown in figure 5 A. The connection needs only to be at one or at a few points along the side. Instead of a weakened tear-line as shown in figure 5 B there could be E.g. two tear-points having the appearance of the tear-line shown in figure 5 B also when viewed from the side.

As shown in figure 7 A-B the reagent carrying strip 3 can be made from a polymeric material which is formed into a very thin film 3. The reagent is applied onto the film 3. The film 3 can be attached to the lancet 1,10 by moulding the film in a way having a part 9, which surrounds the lancet 1,10 and attached to the lancet 1,10. In this way the disposable lancet 1,10 with
5 reagent carrying strip 3 can be moulded in one process, by first placing the lancet 1,10, which is made from metal or from a polymeric material, into the mould and then apply the polymeric material.

In order to avoid the inconveniency of moving the blood-coated strip 3 around the system 11
10 shown in figure 8 uniting a skin pricker and a glucose meter has been developed. The system comprises a housing 15, a hammer 14, a spring 16, a release button 13 and a display 12.

The disposable lancet 1,10 combined with a reagent carrying strip 3 is placed in a guided
15 position in the housing with the spring 16 in the shown compressed position. Releasing the spring 16 by pressing the release button 16 caused the spring 16 carrying the hammer to move forward. When the hammer 14 impacts the lancet 1,10 this is also moved forward. The length of the spring 16 is determined so that the tip 2 of the lancet 1,10 is outside the boundaries of the housing 15 when the spring is released and gone beyond its normal position, but inside the boundaries of the housing 15 when the spring 16 exceeds to its normal
20 position. In this way the finger will be pierced when pressed against the housing 15 upon firing the lancet 1,10.

After the finger has been pierced a droop of blood can be placed onto the reagent carrying
25 strip 3, which is then automatically guided into the combined skin pricker and glucose meter, where a sensor senses the change in the reagent. In order to place the reagent carrying strip 3 in a readable position the strip 3 can be winded around the lancet 1,10, or the whole disposable lancet 1,10 with reagent carrying strip 3 can be automatically shifted to a readable position.

30

Some preferred embodiments have been shown in the foregoing, but it should be stressed that the invention is not limited to these, but may be embodied in other ways within the subject-matter defined in the following claims. The sheet-like reagent carrying strip could, for example, be formed into a circular tube-shaped element, which are fitted around the lancet
35 without falling outside the scope of the claims.

CLAIMS

1. A disposable lancet (1,10) combined with a reagent carrying strip (3), comprising a lancet (1,10), with a distal end (2), which is sharpened for piercing the skin of a user, and a reagent carrying strip (3), which carries a reagent that indicates the concentration of a blood component in a blood sample placed in contact therewith, characterized in that said reagent carrying strip (3) is a sheet-like strip (3) having a first side (4) and a second side (5), which sides (4,5) are both accessible for said user, and that said lancet (1,10) is connected to said reagent carrying strip (3).
2. A disposable lancet (1,10) combined with a reagent carrying strip (3) according to claim 1, characterized in that said lancet (1,10) is made from a moldable polymeric material, and that said reagent carrying strip (3) is attached to said lancet (1,10).
3. A disposable lancet (1,10) combined with a reagent carrying strip (3) according to claim 1 or 2 characterized in that said reagent carrying strip (3,9) is made from a moldable polymeric material, which is moulded around said lancet (1,10).
4. A disposable lancet (1,10) combined with a reagent carrying strip (3) according to anyone of the claims 1 or 3, characterized in that said reagent carrying strip (3) has a number of edges between said first side (4) and said second side (5), and that said lancet (1,10) is attached to said reagent carrying strip (3) at one of these edges.
5. A disposable lancet (1,10) combined with a reagent carrying strip (3) according to claim 4, characterized in that said lancet (1,10) is connected to a frame (8), which frame (8) is attached to one or more of the edges of said reagent carrying strip (3).
6. A disposable lancet (1,10) combined with a reagent carrying strip (3) according to anyone of the preceding claims, characterized in that an arm (6) is connecting said lancet (1,10) to said reagent carrying strip (3) or to said frame (8).
7. A disposable lancet (1,10) combined with a reagent carrying strip (3) according to anyone of the preceding claims, characterized in that the connecting point (7) between the reagent carrying strip (3) or the frame (8) and the disposable lancet (1,10) or the arm (6) has a weakened tear line.

8. A disposable lancet (1,10) combined with a reagent carrying strip (3) according to anyone of the preceding claims, characterized in that said reagent carrying strip (3) is rectangular

5 9. A system (11) for extracting and analyzing blood in a body utilizing a disposable lancet (1,10) combined with a reagent carrying strip (3) according to anyone of the preceding claims, which system (11) comprises:

10 a housing (15) including a spring (16) actuated hammer (14), into which housing (15) said disposable lancet (1,10) combined with a reagent carrying strip (3) is placed in a guided position,

15 a button (13) which released said spring (16) actuated hammer (14), which then pushes forward said disposable lancet (1,10) combined with a reagent carrying strip (3), means for guiding said disposable lancet (1,10) combined with a reagent carrying strip (3) from a retracted position to a deployed position where the tip of said disposable lancet (1,10) combined with a reagent carrying strip (3) penetrates the skin of the user,

20 a sensor which senses the changes in the reagent placed on said reagent carrying strip (3),

a display (12) for showing a visual readout representing the changes in the reagent

characterized in that said sensor is situated in a position in said housing (15) where it can sense the changes in the reagent without manually moving said disposable lancet (1,10) combined with a reagent carrying strip (3).
